# **I. Introduction**

The developed system starts with a welcome message that briefly introduces the user how to use it. The user interface is provided by a command-line interpreter, frequently known as **shell**, where the user can execute different actions by entering the corresponding command as text.

The software also provides a graphical user interface named **LoMoG** (after **Lo**co-**M**ouse **G**UI), that is used by the command menu, which displays an interactive button based menu with all the available single-arguments commands.

## II. Commands' Table

Command	Synopsis	Description
